

Debris Diverter (Leaf Slide)

Prevent blocked pipes whether you're on Mains Supply or Water Tanks. The Debris Diverter (leaf slide), has been designed to keep solid matter out of pipe work leading to your Water Tank, Soak Trench or Council Storm Water mains.

FEATURES

It's your water tank's first defence from debris. The Debris Diverter (often called a Leaf Slide) assists in keeping other water filtration devices, e.g. filter cartridges in filter housings work more effectively and for longer by reducing the roof debris passing through them.

Self flushing design - with an 80° full shroud creating a large splashing effect when leaves and debris are sitting on the stainless steel mesh slide, which will assist with the self-flushing of the Debris Diverter.

MODELS

The Debris Diverter Short is a "Straight Through" diverter. This means that the water comes through the top of the diverter, passes through the mesh screen, and out the bottom of the diverter into your pipe work before carrying onto your water tank or mains wastewater.

The Debris Diverter Tall allows you to fit the debris diverter right at the top of your downpipe and glue the pipe work from the guttering directly into the front of the Debris Diverter.

The Debris Diverter is a new and improved Leaf Slide designed to be plumbed in from the front.
